

Roadmap outline

Where the Concordance project goes after its first site.

Six slides framing the next loops of the tool.

A deck, its PDF preview and its notes, grouped by the build into one page.

A static site from markdown repositories

Every note becomes an entity page, every recurring expression a keyword page.

Every doubt is a finding in the build log, never a stopped build.

Two builds of unchanged sources give byte-identical files.

Decks, transcripts and their notes

Office documents converted to PDF at publication, cached by fingerprint.

Transcripts read cue by cue, speakers pseudonymised before anything else reads them.

Twin resources recognised as one page with tabs.

The operations an API really exposes

An API note declares its contract; the build imports the operations.

Each operation note absorbs the operation it names.

A purpose-built viewer renders the contract under the page budget.

A linter where the notes are written

The same checks in the merge request and in the build.

A SARIF log in the margin of the diff, an error finding fails the check.

The wiki keeps pace with the tool: every check has its rule note.

5 · LATER

A service beside the command line

A model query API for the screens that cannot read model.json.

Suggestions reviewed on a screen and recorded in the lock file.

Nothing of it exists in this version; the specifications describe it as a target.
